

ROOIKAT APEX

Regime-Adaptive Automated Trading for MetaTrader 5

RooiKat Apex doesn't guess the market's direction — it measures it. A weighted committee of ten independent technical factors continuously scores the current market regime on a 0–100% confidence scale, and every trading decision — entries, position sizing, profit-taking, and protection — flows from that one number.

What Makes It Different

Regime-Weighted Decision Engine

Ten independent technical factors — spanning trend, momentum, volatility, and volume — each vote on market direction with an adjustable weight. The result is a single, transparent confidence score, not a black-box signal.

Adaptive Position Building

Rather than one all-or-nothing trade, RooiKat Apex builds a position in stages as the market continues to confirm the same regime — with position size that scales with conviction, not blind escalation.

Truly Cross-Pair, Cross-Timeframe

Every distance and risk calculation is derived from the market's own current volatility (ATR) — never a hardcoded value. The same engine works across Gold, forex majors, or indices, on any timeframe.

No Martingale, Ever

Position sizing scales with confidence, never with consecutive losses. There is no doubling-down logic anywhere in the system.

How It Works

01 Vote

Ten independent factors — trend, momentum, structure, volatility, volume — each cast a weighted vote on direction, every tick.

02 Score

Votes combine into one live confidence reading, 0–100%, shown as a single number on your chart — not ten conflicting indicator lines.

03 Gate

Entries, position adds, and exits only fire once confidence clears your threshold. Below it, the engine simply waits.

04 Protect

Position size, basket caps, and dual-layer stops all scale with conviction — never a flat bet on an uncertain read.

Risk & Protection

- Dual fail-safe stops — ATR-based soft stop plus a hard equity-floor backstop
- Account-level kill switches — daily loss limit, total drawdown limit, equity floor, consecutive-loss pause
- Confidence-scaled dynamic position sizing — bigger size only when the market earns it
- Basket-level caps to control total exposure across DCA legs
- Auto GMT session detection — no manual timezone setup
